

REAL-TIME CONTACT CENTER EVENT PLATFORM

Self-initiated AWS platform reduced reported data availability from 24+ hours to 2-10 minutes

ROLE

Solutions Architect / Data Engineer

PRODUCTION SCOPE

Original production rollout + Caribbean deployment

THE CHALLENGE

BUSINESS IMPACT

API-based extraction jobs produced 24+ hour reporting delays, recurring escalations, and fragmented data access.

OPERATING-MODEL CONSTRAINT

Data Engineering repeatedly became the permanent owner of bespoke reports instead of enabling governed analytics.

ARCHITECTURE AT A GLANCE

DECISIONS AND CONTRIBUTION

1 INITIATED THE PLATFORM

Identified the recurring pain independently, proposed the event-driven alternative, and owned the architecture through production delivery.

2 DESIGNED FOR FIDELITY

Separated append-only raw capture from partitioned analytical data; handled progressive and late events in curated latest-state views.

3 MADE IT REPEATABLE

Standardized seven streaming domains with IaC, replay, failure isolation, alarms, and governed Athena access; then deployed the pattern to a second market.

REPORTED PRODUCTION OUTCOMES

2-10 min

data availability, down from 24+ hours

7 + 1

streaming domains plus one API reference-data exception

2 markets

original production deployment and Caribbean rollout

Observed during the supported production period; customer data, internal identifiers, and telemetry are intentionally excluded.
